HISTORY

The TZMO Group has over 70-year history. Thanks to the knowledge and experience in the production of medical and hygienic devices acquired since 1951, we have managed, in the new economic conditions which began in Poland at the beginning of the 1990s, to build a Polish company that can pursue its strategy based on the assumption of manufacturing and trading activities in the global market.

WHO WE ARE

We are a manufacturer and supplier of medical and hygienic devices as well as cosmetics to the global market. With years of experience and state-of-the-art production technologies, we deliver devices of the highest quality. The TZMO Group comprises **56** companies in Poland and abroad, where we employ over **9,000** people. We sell our devices in more than 80 markets.

OUR MISSION

TZMO Group's mission is to provide its customers with the highest quality products so that they live a better, more comfortable and safer life. We respond not only to current needs but also anticipate what our customers will need in the future and strive to deliver that today. As we plan our global expansion, we are mindful of meeting the needs of our customers. TZMO SA products are based on state-of-the-art technology and are of the highest quality, regardless of the country in which they are available.

BUSINESS RESPONSIBILITY

We are actively involved in developing the area of long-term care. Since 1998, TZMO SA has been organising the International Long-Term Care Conference, which is attended each year by more than 1,000 professionals involved in health and social care.

An important social initiative for chronically ill, disabled and elderly people is the Seni Cup International Football League for Disabled, which has been organised since 2000.

More than 3,000 athletes – nursing home residents from all over the world – take part in the event.

As a natural consequence of our activities to date, in 2011 we established the TZMO Foundation 'Together We Change the World', through which we can act even more extensively and which serves as a bridge between those in need of help and those who can offer it.

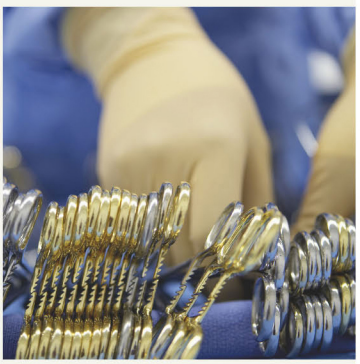
TZMO Foundation

Together We Change The World

CITONET SERVICE CENTRES

The CitoNet Service Centre network specialises in the provision of laundry and sterilisation services, the production of customised sets for doctors and the sale of medical devices. In Poland, we are present with the CitoNet brand in 9 locations (including 2 leased).

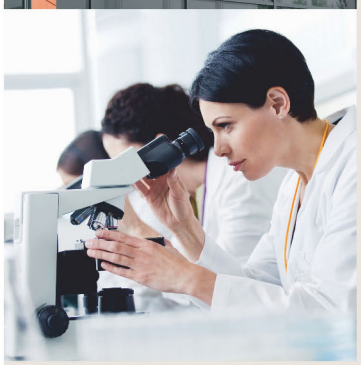
For more than twenty years, we have been developing a network of CitoNet Service Centres in Poland, specialising in the processes of sterilisation, laundering, rental of surgical instruments and linen, as well as the completion of sterile sets. We are present with our services in several cities in Poland: in 2001, TZMO established CitoNet in Łódź, providing sterilisation services; three years later, another two CitoNet Service Centres were opened in Bydgoszcz and Kraków, and in 2006 in Szczecin. In 2008 and 2009, the centres in Bydgoszcz and Łódź extended their activity by laundry service. In 2011, CitoNet in Swarożyn near Tczew was opened and since 2015, we have been providing laundry and sterilisation services in Warsaw. Since 2017, CitoNet in Kraków has also been providing laundry services, with CitoNet in Czeladź and Szczecin also joining in 2021 and 2022.
We intend to continue this activity by opening further Service Centres both in Poland and abroad. Through the services provided by CitoNet, we are primarily concerned with the comfort and safety of medical staff and patients and additionally help to reduce the operating costs of the medical facility. We want to make a difference in hospitals by offering state-of-the-art solutions for laundry services, the rental of barrier and shaped garments, as well as the sterilisation of surgical instruments and linen and the comprehensive supply of broadly defined dressing material. Experience and proven management methods give the medical facilities a 100 per cent guarantee that the services outsourced to CitoNet Service Centres will be delivered to the highest standards.



WE BELIEVE THAT SPECIALISED PRODUCTS SHOULD BE SUPPORTED BY SPECIALISED SERVICES

MATOPAT SPECIALIST HOSPITAL

– has been providing surgical treatment in neurosurgery, ophthalmology, gynaecology, orthopaedics, general surgery and urology since 2001. We offer treatment of patients in comfortable conditions and the highest quality of medical services, delivered by high-performance staff and using state-of-the-art equipment.
The MATOPAT SPECIALIST CLINIC, which has been operating since 1998, offers outpatient specialist treatment in most medical specialities following the extension of the practice building completed in 2022. It offers a range of diagnostic tests in the X-ray, ultrasound, cardiology, endoscopy and magnetic resonance laboratories with a 3 Tesla scanner.
The clinic has around 100 specialist doctors who, in collaboration with midwives, nurses, physiotherapists, medical technicians and other staff, provide comprehensive diagnosis, treatment and care for our patients.



WE ARE CONSTANTLY IMPROVING
OUR QUALIFICATIONS AND THE QUALITY
OF HEALTHCARE SERVICES WE PROVIDE.

TRICOMED RESEARCH AND DEVELOPMENT CENTRE

TRICOMED SA has the status of Research and Development Centre. We work closely with renowned scientific institutions, contributing to solving problems in the fields of medical and material engineering, medicine and cosmetology. In carrying out research projects, we use both national and European public funds. TRICOMED SA achievements to date include dozens of patents, many awards, and above all – a prestigious place among the few manufacturers of knitted biomaterials in the world.

PRESENCE AT WORLD MEDICAL FAIRS

TZMO SA actively participates in many international specialised trade fairs such as Altenpflege and Medica (Germany) and MedTrade (USA).

OUR BRANDS

Seni - absorbent and skin care products for people with incontinence

Bella - hygienic products for women

Bella baby Happy - hygienic products and cosmetics for babies and children

Matopat - range of medical devices

CitoNet - a network of sterilisation service centres and medical laundries

Tricomed - research, biomaterials and specialist dressings

Eva - face, body and hair cosmetics

Kanion - men's care products

Bella No 1 - hygienic products and cosmetics for the whole family

Bella cotton - cotton hygienic products

Bella mamma - range for postpartum and breastfeeding women

dr MAX - biodegradable home cleaning products

My friend - sanitary pads and cosmetics for animals

MATOCOMP

DRESSING GAUZE

Dressing gauze is made of hydrophilic bleached gauze, guaranteeing high chemical cleanliness.
To increase user safety, there are no loose fibres on the surface of the gauze.

GAUZE SWABS

Gauze swabs are made of bleached gauze. To ensure safety, the edges of the swabs are folded inside to eliminate the risk of free fibre release. Sterile swabs are the primary dressing material used to absorb fluids during treatment of injuries and cuts. Non sterile swabs should be used after sterilisation.

MATOVLIES

NONWOVEN SWABS

The nonwoven material which Matovlies swabs are made from is very soft, which makes the dressing material highly flexible and well-forming to the body shape. The cohesive structure of the nonwoven excludes loose fibres on the surface and at the same time allows the slit to adjust the device to individual needs. Sterile swabs are designed to absorb fluids during surgical and outpatient procedures and to dress all types of wounds.
Non sterile swabs should be used after sterilisation.

NEUROCOMPRESS

NEUROSURGICAL SWABS

Neurosurgical swabs are made of soft and easy-to-form 4-ply nonwoven fabric with high absorbent ability. They have a firmly attached X-ray-detectable thread allowing quick identification of the swabs left in the operating field. Swabs are placed 10 pieces at a time on a special cardboard pad for better organisation in the unit pack.

APPLICATION:

the swabs are designed for absorbing fluids, blood and cerebrospinal fluid during neurosurgical procedures.

ABDOMA

ABDOMINAL SWABS

Abdominal swabs are made of cotton gauze. The edges of the swab are secured to prevent loose threads from pulling out. In addition, the swab is equipped with a permanently placed X-ray detectable thread. It can also have a loop for fixing the loop outside the operating field. Sterile swabs are designed to absorb fluids during surgical procedures and can be used to directly dress extensive wounds and injuries.
Non sterile swabs should be used after sterilisation.

TUPFER

GAUZE OR NONWOVEN TAMPONS

The tampons are made of cotton gauze. The fine surgical material is characterised by its small size while the device is highly absorbent. The diversity of shapes makes it possible to match the tampons precisely to individual needs. Sterile tampons are used to absorb fluids during surgical and outpatient procedures. In addition, they are used to disinfect the patient's skin.
Non sterile tampons should be used after sterilisation.

NOTE: Use the product in an unfolded state.

The table shows the diversification of the offer for the BALL-shaped tampons (multiple sizes, sterile or non sterile, with or without X-ray thread, and different packaging options). All types of tampons shown in the pictures are available. Selected shapes and sizes are also available in a nonwoven version.

SETON

GAUZE OR NONWOVEN ROLLS

Rolls are made of gauze. All edges of rolls are folded inside, preventing loose threads from pulling out. The treatment material is characterised by its small size while being very highly absorbent at the same time. Sterile rolls are used to absorb fluids during surgical and outpatient procedures.
They are used during gynaecological and urological procedures, among others.
Non sterile setons should be used after sterilisation.

NOTE: Use the product in an unfolded state.

ABSORBA

ABSORBENT SWABS

The absorbent swab is made of bleached cotton gauze and medical nonwoven fabric with high absorbent properties.
The total number of layers in the absorbent swab (1) is 16 (8 layers of gauze, 8 layers of nonwoven fabric).
Thanks to the combination of two raw materials, the swab has increased absorption capacity in comparison with pure gauze swabs. The absorbent swab is also available in an additionally stitched version (2).
Sterile swabs are designed to absorb fluids from patient wounds in operating rooms and outpatient departments.
Non sterile swabs should be used after sterilisation.

ABSORBA

COTTON WOOL AND GAUZE TAMPONS

The tampons are spherical swabs, with an outer gauze layer with an absorbent pad made of cotton wool inside. Every tampon has a cotton thread attached which enables its removal from the patient's body. Sterile tampons are designed to absorb body fluids during surgical procedures (e.g. in gynaecology).
Non sterile tampons should be used after sterilisation.

ABSORGYN

GYNAECOLOGICAL TOWELS AND RECTANGULAR ABSORBENT PADS

The Absorgyn gynaecological towel is a device recommended for women in the postpartum period and after gynaecological procedures and surgeries, designed to absorb blood and secretions. The pad consists of a layer responsible for absorbing liquids and providing a barrier against leakage (film version). Disposable device. The exceptional absorbency and length of the pad provide excellent protection even when lying down. Absorgyn has a delicate nonwoven outer layer and a thick cellulose absorbent core. On the underside, there is a film between the nonwoven fabric and the absorbent pad insert, which provides effective protection against leakage (film version). Film-free versions of the pads are also available.

The Absorgyn rectangular absorbent pad is dedicated to women after deliveries and in the postpartum period, as well as to people with mild incontinence. The pads are used to absorb secretions and protect against leakage. The devices have a rectangular absorbent pad formed from fibrous cellulose, wrapped in a hydrophilic nonwoven fabric. The device is intended for direct skin contact. This device does not contain an insulating layer.

Gynaecological towels can be sterilised by steam or ethylene oxide in a validated process after repackaging for sterilisation. Rectangular absorbent pads can only be sterilised with ethylene oxide.

DRESSING MESHES

CODOFIX® · CODOFIX® PLUS

ELASTIC DRESSING MESHES

Codofix® and Codofix® PLUS dressing meshes are used for fixing dressings on the body, instead of traditional bandage or plaster. The devices are very handy for dressing inconvenient or hard-to-reach places. They are available in the form of sleeves, which makes them easier to use and significantly reduces dressing application time. They are made of polyamide yarn and polyurethane yarn. The PLUS version has a denser structure.
Flexible dressing meshes are offered in the following lengths: Codofix® 1 m and 10 m (respectively: 2.5 m and 25 m stretched) and Codofix® PLUS 25 m (stretched). The length of the mesh can be cut according to individual needs.

CODOFIX®

CODOFIX® PLUS

APPLICATION:

- for fixing dressings on hard-to-dress areas, such as the pelvis or crotch
- for applying on post-operative wounds of abdomen, thorax and head
- for supporting dressings on burn wounds
- in paediatric surgery

DEVICE FEATURES:

- disposable device
- the device is offered in a non sterile version

MATOLAST · MATOBAN

ELASTIC WOVEN SUPPORT BANDAGE

Matolast is a delicate support bandage of high elasticity designed to fix dressings to wounds. It provides a convenient alternative to non-stretch bandages. Thanks to its high elasticity, a correctly applied bandage does not put undue pressure on the protected areas or restrict blood circulation. Soft, and pleasant to the touch, with non-shredding edges, it is a skin-friendly bandage that is well permeable to air.

ELASTIC WOVEN SUPPORT BANDAGE **NON STERILE**

15 cm x 4 m	MA-123-BA40-004	1 pc	70 packs

APPLICATION:

- as light-compressing bandage
- as a stiffening bandage in various applications

DEVICE FEATURES:

- elasticity: 150%
- raw material: polyamide silk, elastomeric yarn
- reusable device
- permissible methods of sterilisation: steam, ethylene oxide, radiation

CODOBAN® · MATOFIX COHESIVE

HIGH ELASTIC BANDAGE

Codoban® is a high elastic bandage with non-shredding edges and ends. It is recommended for gradation of compression. It keeps its properties even after repeated use and washing. The bandage is breathable, making it comfortable to wear.

APPLICATION:

- for treatment of peripheral circulatory system diseases (venous, lymphatic)
- for treatment of post-traumatic changes: limbs, chest
- after surgeries of the head, thorax and limbs
- for prevention of pregnant women
- as stiffening and compression bands

DEVICE FEATURES:

- raw material: polyamide yarn, polyurethane yarn
- reusable device
- device offered in a non sterile version

* relaxed length ** 2 clips

SELF-ADHESIVE ELASTIC BANDAGE

Matofix COHESIVE is a delicate cohesive woven support bandage. As the successive layers of the bandage adhere to each other, it does not require additional fixings such as clips or tapes. The bandage adheres perfectly to the body without restricting freedom of movement. It allows easy use of the bandage in all directions. Its structure ensures the optimum exchange of moisture and heat. The bandage does not slip off or stick to hair, skin or clothing. Excellent air permeability.

APPLICATION:

- as a well-fitting, non-sliding bandage to secure dressings, especially on joints and conical parts of the body
- in supplementary therapy after plaster removal, for the attachment of splints

DEVICE FEATURES:

- elasticity: approximately 90%
- raw material: viscose, cotton, polyamide, synthetic sticky substance
- disposable device
- acceptable methods of sterilisation: steam, ethylene oxide
- latex-free

BANDAGES

MATOPAT UNIVERSAL

UNIVERSAL ELASTIC BANDAGE WITH CLIP

Matopat UNIVERSAL is a universal woven elastic bandage, reusable. The bandage's permanent elasticity, even after being washed several times, has been ensured by the right combination of natural and synthetic fibres. The creped structure of the bandage effectively prevents the dressing from slipping down. Due to its high content of ingredients of natural origin, the bandage is well permeable to air. It can be sterilised, and perfectly keeps its elasticity.
Thanks to its elastic properties, it adapts perfectly to any part of the body, making it versatile in the treatment of joint, muscle and tendon injuries.

APPLICATION:

- fixing dressings, e.g. on wounds
- pressure relieving dressing for the prevention and treatment of injuries to the musculoskeletal system, e.g. sprains, joint strains, tendons and muscles
- light-compression bandage

DEVICE FEATURES:

- elasticity: approximately 120%
- raw material: cotton, polyamide silk, elastomeric yarn
- reusable device
- permissible methods of sterilisation: steam, ethylene oxide, radiation

MATOLAST UNIVERSAL

COLOUR ELASTIC BANDAGE WITH CLIP

Matolast UNIVERSAL is a multi-purpose, colour, woven elastic bandage, reusable. The bandage's permanent elasticity, even when washed several times, is kept by the use of natural and synthetic fibres. High in natural ingredients, the bandage is therefore well permeable to air. It can be sterilised, retaining its flexibility. Due to its elastic properties, it adapts to every part of the body.

APPLICATION:

- fixing dressings, e.g. on wounds
- pressure relieving dressing for the prevention and treatment of injuries to the musculoskeletal system, e.g. sprains, joint strains, tendons and muscles
- light-compression bandage

DEVICE FEATURES:

- elasticity: approximately 150%
- raw material: cotton, polyamide silk, polyurethane
- reusable device
- permissible methods of sterilisation: steam, ethylene oxide

UNIVERSAL ELASTIC BANDAGE WITH CLIP **NON STERILE**

BANDAGES

MATOPAT IDEAL

HIGH-COTTON ELASTIC BANDAGE WITH CLIP

Matopat IDEAL is a delicate compression bandage which, thanks to its high cotton content, is well permeable to air and perfectly tolerated by the skin. It is reusable – due to the right combination of natural and synthetic fibres, it keeps its properties permanently, even after multiple washing.

APPLICATION:

- as a compression bandage
- as a relief bandage in all kinds of injuries of the musculoskeletal system
- as a support bandage with a light compression effect

DEVICE FEATURES:

- elasticity: approximately 70%
- raw material: 67% cotton, polyamide silk, elastomeric yarn
- reusable device
- permissible methods of sterilisation: ethylene oxide

LIMFOSET

LYMPHOEDEMA THERAPY SET

Limfoset lymphoedema therapy sets contain the collection of components needed to prepare a complete compression dressing on a lower or upper limb.

APPLICATION:

- primary lymphoedema, both congenital and occurring at a later age
secondary lymphoedema: after surgical
- operations in which lymph nodes or lymphatic vessels were damaged or removed; caused by inflammatory lesions, trauma, or radiotherapy; after diseases of the venous system or after surgical operations on the superficial and deep veins, after the removal of veins for bypass surgery; after diseases of the rheumatic type

EACH SET INCLUDES:

- cotton sleeve – Tubula COTTON, which protects the skin underneath the compression bandage
- pad – Matosoft SYNTHETIC, which fills the free spaces under the compression bandage, so that blood and nerve vessels are protected from uneven, excessive pressure
- elastic bandages – Matolast, which are used to bandage the fingers/toes
- compression bandages – Matopress, which allow constant superficial compression, thus increasing blood and lymph drainage during therapy
- delicate silk-based adhesive – Plastosilk, which securely fastens the pressure dressing

Lower and upper limb lymphoedema therapy sets are available. Each is available in extended or economy versions.

PLASTOVIS · PLASTOPORE

TEXTILE ADHESIVE TAPE

Plastovis is a classic fabric adhesive tape covered with glue containing zinc oxide. It is characterised by very high strength and very good adhesion. The applied glue perfectly adheres to the skin and the included zinc oxide reduces the risk of skin irritation. A high adhesion rate gives a strong and sure fixation of different types of wound dressings. The serrated edges on both sides allow for tearing in hand, without the use of scissors.

APPLICATION:

- fixation of all types of wound dressings
- fixation of tubes, catheters and other medical devices

TEXTILE ADHESIVE TAPE **NON STERILE**

HYPOALLERGENIC NONWOVEN ADHESIVE TAPE

Plastopore is a delicate nonwoven adhesive tape, which can be used in people with sensitive skin. The microporous nonwoven backing material allows the skin to breathe freely and prevents maceration. The applied acrylic glue does not cause allergic skin reactions. Plastopore can be removed easily and painlessly without leaving any glue residue on the skin. The serrated edges on both sides of the adhesive tape allow for tearing in hand, without the use of scissors.

APPLICATION:

- fixation of all types of wound dressings
- fixation of medical device components

PLASTOSILK · PLASTOFILM

HYPOALLERGENIC SILK ADHESIVE TAPE

The silk-like textile backing of the Plastosilk allows the skin to breathe easily and protects against maceration. The tape is hydrophobic when exposed to liquid for a short time. Plastosilk is a durable adhesive tape yet delicate for the skin. It allows the fixation of dressings or other medical items on the patient's skin. The serrated edges on both sides allow for tearing in hand, without the use of scissors. Particularly recommended for people with delicate and sensitive skin, in cases where a stronger adhesive tape than nonwoven is required.

APPLICATION:

- fixation of all types of wound dressings
- fixation of tubes, catheters and other medical devices

HYPOALLERGENIC SILK ADHESIVE TAPE **NON STERILE**

5 cm x 9.14 m	MA-162-MMMM-306	6 pcs	12 packs

TRANSPARENT MICROPOROUS ADHESIVE TAPE

Plastofilm is a transparent adhesive tape for fixing all types of dressings and medical devices on sensitive skin. The applied acrylic glue does not cause skin reactions. Plastofilm is a very skin-sensitive adhesive tape. It can be removed easily and painlessly, leaving no glue on the skin. The polyethylene base is transparent. This makes it possible to observe fluid levels in tubes, cords and catheters protected by the adhesive tape. Plastofilm allows free gas exchange and prevents maceration of the skin. It is hydrophobic – it does not absorb moisture. The serrated edges on both sides allow for tearing the adhesive tape in hand, without the use of scissors.

APPLICATION:

- fixation of wound dressings
- fixation of tubes, catheters and other medical devices
- fixation of dressings on the face and other sensitive areas

TRANSPARENT MICROPOROUS ADHESIVE TAPE **NON STERILE**

5 cm x 9.14 m	MA-163-MMMM-306	6 pcs	12 packs

PLASTOFIX

NONWOVEN ADHESIVE TAPE

Plastofix is a comfortable in use, soft and elastic tape. It is perfect for holding dressings and fixing additional medical devices. The adhesive tape adjusts perfectly to the body shape enabling the patient's free movement. The protective properties of the adhesive tape minimise the occurrence of accidental wound contamination. Plastofix has a nonwoven microporous backing material which provides high vapour permeability. Plastofix does not inhibit skin respiration or perspiration. The applied acrylic glue reduces the risk of allergic reactions.

APPLICATION:

- fixation of wound dressings on large surfaces (post-operative wounds)
- fixation of wound dressings, especially in tension-exposed areas (joints, groins)
- fixation of compresses or other absorbent dressings
- fixation of catheters and drains

NONWOVEN ADHESIVE TAPE **NON STERILE**

FIXOVIS · FIXOPORE

TEXTILE PLASTER WITH ABSORBENT PAD

Fixovis is made of flexible, durable fabric. The centrally located absorbent pad has high absorption properties and its outer layer is protected by a micro mesh which prevents the dressing from sticking to the wound. The applied acrylic glue reduces the risk of irritation. The 1-metre roll of the dressing allows for precise self-adjustment of the plaster size to the wound.

APPLICATION:

- quick, easy and hygienic dressing of abrasions, cuts and small wounds in patients with normal skin sensitivity

TEXTILE PLASTER WITH ABSORBENT PAD **NON STERILE**

size	code	packaging	box
6 cm x 1 m	MA-166-MMMM-015	1 pc	100 packs

NONWOVEN PLASTER WITH ABSORBENT PAD

The backing material of Fixopore is made of white, elastic nonwoven fabric, which perfectly conforms to the body shape, in joint areas (e.g. elbows, knees) as well. The applied nonwoven is porous, therefore, the skin around the wound can breathe easily. The centrally located absorbent pad has high absorption properties and its outer layer is protected by a micro mesh which prevents the dressing from sticking to the wound. The 1-metre roll of the dressing allows for precise self-adjustment of the plaster size to the wound.

APPLICATION:

- quick, easy and hygienic dressing of abrasions, cuts and small wounds in patients with sensitive skin

IT IS NOT TIME THAT HEALS ALL WOUNDS

MEDISORB MOISTURE WOUND HEALING SYSTEM

Modern wound management system is based on the results of scientific research, which proved that wounds in a moist environment heal on average 50% faster than in a dry environment*.

According to this concept, treatment consists of closing the healing wound with a special dressing which:

- keeps appropriate moisture level on the wound surface,
- initiates autolytic cleansing,
- isolates the wound thermally,
- provides long-term absorption of excess exudate,
- does not stick to the wound,
- is waterproof and protects the wound against external factors.

EXUDATE MANAGEMENT

MEDISORB P PLUS

ABSORBENT POLYURETHANE DRESSING

Medisorb P PLUS dressing is characterised by its ability to treat exudative wounds and clear wounds of necrotic tissue and purulent secretions.
The dressing consists of two layers:

- vapour-permeable polyurethane film with acrylic adhesive - which is the outer layer (with printing), protecting the wound from external factors. The polyurethane foam layer is bonded to the polyurethane film with an adhesive, which is not visible to the user.
- hydrophilic polyurethane foam – responsible for keeping appropriate moisture in the wound, having a high capacity to absorb excess fluids.

It should be fixed with an additional device, i.e. a bandage, adhesive tape or elastic mesh. The Medisorb P PLUS is light, handy and adjustable which enables protection of sacral or heel wounds.

APPLICATION:

Medisorb P PLUS dressing is intended for the treatment of exuding wounds, including:

- after-burn wounds,
- post-operative wounds,
- venous insufficiency shin ulcers,
- vast post-traumatic injuries,
- pressure sores.

The dressing is also suitable for quick cleansing of all types of wounds of necrotic tissue and purulent secretions.

EXUDATE MANAGEMENT

MEDISORB P PLUS ADHESIVE

SELF-ADHESIVE ABSORBENT POLYURETHANE DRESSING

Medisorb P PLUS ADHESIVE dressing is characterised by its ability to treat exudative wounds and clear wounds of necrotic tissue and purulent secretions.
The device is constructed of four layers:

- vapour-permeable polyurethane film with acrylic adhesive – which is the outer layer (with printing), protecting the wound from external factors. The polyurethane foam layer is bonded to the polyurethane film with adhesive, which is not visible to the user,
- hydrophilic polyurethane foam – responsible for keeping appropriate moisture in the wound, having a high capacity to absorb excess fluids,
- hypoallergenic acrylic adhesive – an adhesive layer which allows the dressing to be attached to the wound,
- paper – the layer which protects the adhesive.

APPLICATION:

Medisorb P PLUS ADHESIVE dressing is intended for the treatment of exuding wounds, including:

- after-burn wounds,
- post-operative wounds,
- venous insufficiency shin ulcers,
- vast post-traumatic injuries,
- pressure sores.

The dressing is also suitable for quick cleansing of all types of wounds of necrotic tissue and purulent secretions.

ACCELERATED HEALING AND INFECTION CONTROL

MEDISORB R

RESORBABLE DRESSINGS

Medisorb R MEMBRANE is a sterile, resorbable dressing in the form of a porous membrane, used for the treatment of chronic and difficult-to-heal wounds.

Medisorb R POWDER is a sterile, resorbable dressing in the form of powder, used for the treatment of deep, chronic and difficult-to-heal wounds.

The medical device construction makes it possible to create an optimal regenerative environment. The dressing undergoes resorption under the influence of enzymes present in the wound. The products of the dressing's decomposition are substances naturally present in the human body which affect tissue regeneration. The porous structure of the dressing makes it possible to evacuate excess exudate outside the wound environment, and thanks to resorption there is no need to replace it, which eliminates the pain associated with it and allows the newly formed tissue to be protected from damage.

The medical device contains butyryl-acetyl chitin copolyester.

APPLICATION:

The dressing is intended for the treatment of exudative chronic wounds which are difficult to heal, infected or non-infected, with a variety of underlying causes, including:

- wounds of venous aetiology,
- diabetic foot,
- pressure sores,
- post-traumatic wounds,
- surgical wounds,
- post-burn wounds.

Medisorb R POWDER dressing is also intended for the treatment of deep wounds.

ACCELERATED HEALING AND INFECTION CONTROL

MEDISORB R Ag

RESORBABLE DRESSINGS

Medisorb R Ag is a sterile, resorbable dressing with microsilver in the form of a porous membrane, used for the treatment of chronic and difficult-to-heal wounds. The medical device construction makes it possible to create an optimal regenerative environment. The dressing undergoes resorption under the influence of enzymes present in the wound. The products of the dressing's decomposition are substances naturally present in the human body which affect tissue regeneration. The porous structure of the dressing makes it possible to evacuate excess exudate outside the wound environment, and thanks to resorption there is no need to replace it, which eliminates the pain associated with it and allows the newly formed tissue to be protected from damage. The addition of microsilver prevents secondary wound infections.

The medical device contains butyryl-acetyl chitin copolyester and microsilver.

APPLICATION:

The dressing is intended for the treatment of exudative chronic wounds which are difficult to heal, infected or non-infected, with a variety of underlying causes, including:

- wounds of venous aetiology,
- diabetic foot,
- pressure sores,
- post-traumatic wounds,

MEDISORB R Ag — MEDISORB R Ag + MEDISORB P PLUS

MEDISORB P SILVER

ABSORBENT DRESSINGS WITH SILVER

Medisorb P SILVER dressing has the ability to treat exudative wounds, infected or wounds at risk of secondary infection. The device is constructed of three layers:

- vapour-permeable polyurethane film with acrylic adhesive – which is the outer layer (with printing), protecting the wound from external factors. The polyurethane foam layer is bonded to the polyurethane film with an adhesive, which is not visible to the user,
- hydrophilic polyurethane foam – responsible for keeping appropriate moisture in the wound, having a high capacity to absorb excess fluids,
- active layer whose main components are chitosan and microsilver (metallic silver with a particle size in the micrometre range) – providing an aseptic wound environment and conditions favourable for the wound healing process.

APPLICATION:

Medisorb P SILVER dressing is intended for the treatment of wounds with moderate and high exudation, infected or at risk of secondary infection.
Due to its properties, the device can be used for:

- shin ulcers,
- pressure sores,
- post-operative wounds,
- vast post-traumatic injuries,
- treatment of wounds associated with the so-called diabetic foot.

MEDISORB SILVER* · MEDISORB SILVER PAD*

ABSORBENT DRESSINGS WITH SILVER

Medisorb SILVER sterile dressing and Medisorb SILVER PAD are flexible, vapour-permeable dressings which allow the skin to breathe. They absorb excess secretions while maintaining a moist environment in the wound. The silver ions contained in the dressing stimulate the development of granulation tissue and have an antibacterial effect. The acrylic adhesive contained in Medisorb SILVER is gentle to the skin.

The dressing should be changed 1 - 2 per week.

APPLICATION:

Medisorb SILVER and Medisorb SILVER PAD can be used for local treatment of:

- hard-to-heal wounds,
- infected wounds,
- sites from which the transplant was taken.

HOW TO APPLY

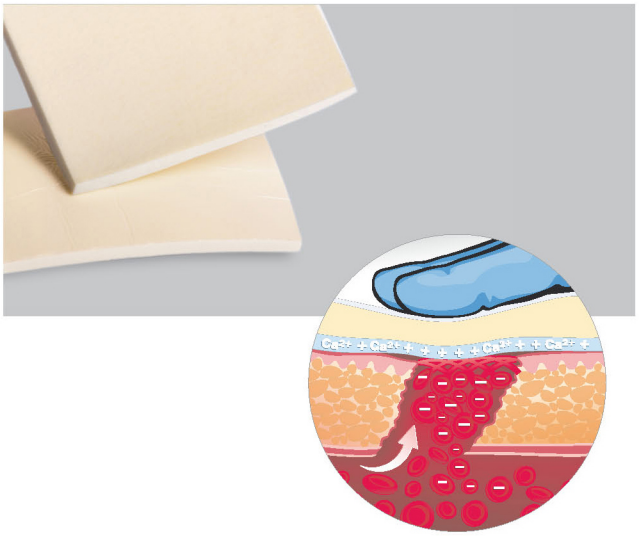
TROMBOGUARD®

TRICOMED

HAEMOSTATIC DRESSING FOR FIRST AID AND TRAUMATIC WOUNDS

Tromboguard® is characterised by its ability to stop bleeding (local haemostatic effect) - it has clinically documented haemostatic properties - when applied with pressure, it stops bleeding within three minutes. The device is constructed of three layers:

- vapour-permeable polyurethane film with acrylic adhesive – which is the outer layer (glossy, with Tromboguard® printing), protecting the wound from external factors. The polyurethane foam layer is bonded to the polyurethane film with an adhesive, which is not visible to the user,
- hydrophilic polyurethane foam – responsible for keeping appropriate moisture in the wound, having a high capacity to absorb excess fluids (blood),
- active, rough layer, which is applied to the wound, with the haemostatic effect, the main components of which are the chitosan and the alginates.



APPLICATION:

Tromboguard® dressing has haemostatic properties and is intended for first aid and/or dressing of traumatic and post-operative wounds.
The device can be used in field conditions.

Perfect for home and emergency first aid kits.

CODOSIL® ADHESIVE / CODOPRESS® PREMIUM

SILICONE DRESSING FOR REHABILITATION OF SCARS

Codosil® ADHESIVE is a soft multilayer dressing meant for the rehabilitation of scars, including hypertrophied scars and keloids. It is perfect for both hypertrophied, low-elastic burn scars (hypertrophic scars and keloids) and fresh surgical scars, such as caesarean section scars. Special shapes dedicated to scars after breast surgery are also available. Codosil® ADHESIVE, together with Codopress® PREMIUM compression devices, constitutes a complete system used as compression therapy, which has been used for years in the successful rehabilitation of extensive burn scars – both in children and adults. It reduces the size, redness and itching of scars.

APPLICATION:

Codosil® ADHESIVE is recommended to be used:

- for rehabilitation of hypertrophied scars and keloids,
- as a prophylaxis in people with hypertrophic scar and keloid tendencies.

SILICONE DRESSING FOR REHABILITATION OF SCARS **NON STERILE**

size	packaging
7 cm x 7 cm	1 pc
7 cm x 14 cm	1 pc
14 cm x 14 cm	1 pc
Breast 1	1 pc
Breast 2	1 pc

COMPRESSION GARMENTS

Codopress® PREMIUM devices are manufactured on the basis of individual orders. For best aesthetic results, compression devices should be used as soon as wounds are fully healed. The duration of use of Codopress® PREMIUM is usually not less than 6-9 months and lasts until clear signs of rehabilitation (flattening, fading and softening of the scar) appear. The exact duration of use of the garment is determined by the treating physician.
The entire therapy generally requires the purchase of compression garments several times, depending on wear and tear or changes in patients' dimensions (especially in children). Compression garments such as a glove or sock, due to the place of use, can wear out faster than other devices.
In order to increase the patient's comfort and the effectiveness of the therapy, a combined treatment is recommended, combining Codopress® PREMIUM compression garments together with Codosil® ADHESIVE silicone dressings for scar rehabilitation.

APPLICATION:

Codopress® PREMIUM compression garments are used to prevent hypertrophic scars after burns and surgery and scarring (keloids).

Unless otherwise indicated (*), medical devices **covered by the certificate** are under the supervision of the Notified Body TÜV NORD Polska Sp. z o.o. and hold CE number 2274.

PROCEDURE SETS

MATOSET

Matoset devices are used in operating theatres, treatment rooms, ambulatories, dialysis stations and hospital wards. Due to years of experience and cooperation with many authorities in the medical field, we constantly develop and improve our offer. In this way, we ensure the comfort and safety of staff and patients and additionally make it possible to save operating costs and workload in the institutions.
Thanks to this, the hospital staff can concentrate on their major mission - to treat people and help them get back to health.

RIGID BLISTER PACKAGING

A rigid blister is more than packaging. Its basic function is to safely pack medical devices, but the blister packs can also be used as containers for liquids or waste, eliminating the need for additional containers. The arrangement of the devices and the possibility of using one or more chambers inside the packaging increases working comfort and the thick film of which it is made increases transport and storage safety.

TAG LABEL

TAG label on the packaging guarantees faultless transfer of necessary data into medical documentation, which improves efficiency and working comfort.

PROCEDURE SETS

MATOSET

Using procedure sets, whose composition has been perfectly tailored to an individual procedure, can reduce the costs associated with the purchase of dressing materials and the number of waste, and thus increase the comfort and safety in the hospital.

MATOSET INSTRUMENT

DISPOSABLE INSTRUMENTS

Matoset INSTRUMENT are sterile plastic or metal disposable instruments, as well as other items packaged individually or that can be components of Matoset sets.

They include:

- swab sticks, spatulas,
- drains, stopcocks, ramps, aspirators, connectors, catheters,
- clamps: Pean forceps, Kocher forceps, sponge forceps, needle holders,
- containers, kidney dishes, cups and bags,
- cutting instruments: scissors (e.g. for cutting sutures, for cutting the perineum, for cutting the umbilical cord), blades and scalpels

SURGICAL SETS AND DISPOSABLE DRAPES

MATOSET & MATODRAPE

MODERN SOLUTIONS FOR OPERATING THEATRE

The sterile, disposable sets contain the items needed for a given medical procedure, which shortens the time devoted to preparing for surgery, reduces waste and lowers the number of products in stock on wards.

The following components might be found in operative sets:

- dressing material – swabs, absorbent dressings, abdominal swabs, tampons, cotton balls
- disposable medical instruments – metal or plastic
- supplementary items – syringes, needles, catheters, plasters, drains, gels, etc.
- biomaterials
- drapes and OP-drapes – made of nonwovens or laminate
- covers and accessories – leg covers, Mayo table covers, hand towels, fixing tapes, incise film, etc.
- medical clothing – gowns, caps, masks, shoe covers, gloves, sets of garments, patient clothing

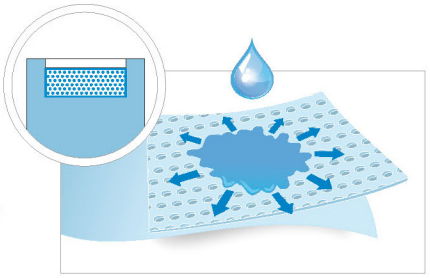
3-layer laminate

plus

PLUS – an additional absorbent layer with exceptional absorption properties used in the critical part of the main drapes perfectly distributes blood, liquids used during surgery and body fluids. Liquids are distributed in all directions even on a vertical surface. An additional absorbent layer allows for an increase in the overall absorbency of the drape while leaving it soft and easy to position in the surgical field.



PRACTICAL DOUBLE PACKAGING WITH A DISPENSER

MATODRAPE

MAYO TABLE COVER

The cover is used for sterile protection of the Mayo table. The absorbent layer enables the absorption of fluids from medical instruments used during the procedure, the film layer, on the other hand, prevents fluids infiltration on the table.
Telescopic folding makes the application much easier and prevents incidental contamination. The sandblasted film prevents the cover from moving.

STERILE

size	code	packaging	box
145 cm x 80 cm	MA-134-SEMI-001	1 pc	60 packs
145 cm x 80 cm reinforced	MA-134-SEMI-012	1 pc	40 packs

INSTRUMENT TABLE COVER

The cover is used for the protection of the instrument table on which sets of drapes and instruments are placed. The absorbent layer in the middle part of the cover collects fluids, the film layer retains them and prevents them from infiltrating.

STERILE

MATODRAPE

INCISE FILM

Sterile incise film is used to protect the surgical field and prevents microbial penetration. It reduces the risk of infection and prevents the drape from moving within the surgical field. The film is stretchable and flexible, giving it the ability to adapt to the shape of the patient's body. It is permeable to water vapour, does not cause skin irritation, is latex-free, does not cause allergic reactions and is not cytotoxic.
Incise films are made of polyurethane film protected by silicone paper. Film borders are equipped with coloured fingerlifts, which enable the application of the device to the designated surgical area. In addition, the film is wrapped in silicone paper.

STERILE

size	code	packaging	box

POUCHES FOR LIQUIDS/INSTRUMENTS

A film pouch is used for storing fluids, suction devices, surgical instruments at hand and small dressing material. The pouch can have either one or two chambers. The stiffening element makes it possible to form a pouch and a transparent film helps to identify its content. The film pouch with adhesive fastening is used for storing and carrying transplant organs.

MEDICAL FIXING TAPES AND CABLE ORGANISERS

Medical fixing tape is used for fixing drapes, drains, cables, etc. Elasticity of the raw material of the tape enables its adjustment and the use of the fingerlift allows for fast application.
The Velcro fixing tape has two parts: hooks and loops. Both parts have adhesive backing and protective paper with a fingerlift. One part of the tape is fixed to a specific location on the drape and the other part can be taken off and reattached many times if needed.
The organisers have a self-adhesive fixing and three openings to organise drains, cables, etc., used during surgery.

PROTECTIVE COVERS ON A ROLL

Protective covers on a roll are used for protecting beds, mattresses, lounges, chairs and other medical devices. A wide size range makes it possible to match the size and type of device to be covered. Laminate covers 1 consist of an absorbent layer and film to prevent soaking. Hydrophobic nonwoven covers 2 provide an effective barrier against exfoliated skin, dust and hair.

170 cm x 90 cm	MA-133-SEBS-002	100 pcs	1 pack

DENTAL BIBS

The bibs are made of 2-layer laminate. The film provides excellent protection against soaking and the other has good absorbent ability.
The bibs are wrapped on a roll and the perforation makes it possible to separate one piece of the device.
Special ties and a cut-out, once torn off, help to place the bib over the patient's neck.

MEDICAL FACE MASKS

Medical face masks are made of three layers of nonwoven fabrics. Thanks to the internal filter layer (bacterial filtration efficiency BFE ≥ 98%), the masks protect against the spread of infectious agents via the droplet route. They have a shaping insert with which they can be closely fitted to the contour of the nose and are equipped with elastic elements for securing the device to the face. The central part of the mask has folds to allow it to fit the shape of the face. The masks meet the requirements of EN 14683 for type II and type IIR. Type IIR medical face masks are made of splash-proof nonwoven. The offer includes type II masks in sizes M (Medium) and L (Large), as well as type IIR masks in size L (Large).

VLIESKOMFORT

SETS OF NONWOVEN BEDCLOTHES

Disposable bedclothes are offered both as sets of bedclothes **(1)** and as individual components. The duvet covers and pillowcases contain folds **(2)** which prevent the duvet, pillow or blanket from slipping out. The duvet is turned up on the left side **(3)** to make it easy and quick to apply the duvet cover or pillow case. Nonwoven and laminate sheets are also available with sewn-in elastic bands **(4)** to hold the device in place and secure the mattress.

SURGITOUCH POWDER-FREE*
SURGITOUCH H POWDER-FREE*

SURGICAL GLOVES

Sterile surgical gloves are made of natural rubber latex. They are characterised by high flexibility and mechanical strength. They provide an effective protective barrier and the rolled edge of the cuff makes them easy to put on. The textured surface of the glove grip section allows efficient instrument handling. The anatomical shape of the gloves and various shapes for the left and right hand ensure comfort in use. Suitable for use during all invasive surgical procedures. They are available in powder-free and powder-free gel-coated versions. Radiation sterilised.

- The gloves meet the requirements of standards:
  Regulation (EU) 2017/745 on medical devices, EN 455,
  Regulation (EU) 2016/425 on personal protective equipment – cat. III,
  EN ISO 21420,
  EN 16523-1
  EN ISO 374.

GLOVES

AMBULEX NITRYL

EXAMINATION AND DISPOSABLE PROTECTIVE GLOVES

Non sterile examination gloves are made of synthetic nitrile rubber. They are characterised by high breaking strength and their rough surface enhances grip for efficient instrument handling. They do not contain natural rubber latex. Particularly recommended for people who are allergic to latex. The gloves are powder-free.

- They meet the requirements of standards:
  Regulation (EU) 2017/745 on medical devices,
  EN 455,
  Regulation (EU) 2016/425 on personal protective equipment - cat. III,

AMBULEX VINYL

VINYL EXAMINATION GLOVES

Examination gloves are made of polyvinyl chloride and do not contain natural rubber latex. Due to their composition and properties, they are recommended for procedures where high mechanical force is not required and for non-invasive medical procedures where body fluids, blood and chemicals are not present.
They are available in a powder-free version.

- They meet the requirements of standards:
  Regulation (EU) 2017/745 on medical devices,
  EN 455.

CITONET – SERVICES AND REUSABLE DEVICES

CitoNet brand ____ 115

Reusable barrier surgical drapes ____ 117

Reusable barrier surgical gowns ____ 119

Reusable barrier surgical clothing ____ 121

Reusable clothing for medical personnel ____ 126

Reusable bedclothes ____ 127

Barrier devices, sterilised in CitoNet companies, are **certified** medical devices under the supervision of the Notified Body TUV NORD Polska Sp. z o.o. and hold CE number 2274.
This applies to devices introduced as sterile and placed on the market for the first time.

CITONET BRAND

CITONET

SERVICES

CitoNet is a brand created by Toruńskie Zakłady Materiałów Opatrunkowych SA to meet the expectations of its customers in terms of comprehensive and innovative solutions ensuring security and financial efficiency. CitoNet service centres specialise in sterilisation processes, laundering, and renting surgical instruments and surgical clothing and bed linen. By choosing to outsource, hospitals can focus on their core mission of treating patients by putting other processes in the hands of professionals.

We implement, maintain and continuously improve management systems according to standards: **ISO 9001, ISO 13485, EN 14065 i ISO 14001**.

We offer our customers:

- comprehensive service carried out using validated washing and sterilisation processes,
- completion of sets for medical procedures according to individual requirements,
- inspection, repair, reconditioning or replacement of bed linen and instruments as well as maintenance service,
- monitoring and recording of the circulation of bed linen using RFID,
- production and services in compliance with the applicable legal requirements,
- delivery and collection of devices directly to and from the ward,
- distribution of surgical clothing using modern equipment,
- professional advice, verification of needs and matching the best solution,
- cooperation with the customer at every stage of the service.

We implement new projects together with the customer and are open to any suggestions.

We develop and offer more and more advanced devices characterised by high quality and safety during use in medical facilities.

New technological solutions implemented in our customers' facilities improve efficiency, save time, and allow for greater focus on patient care.

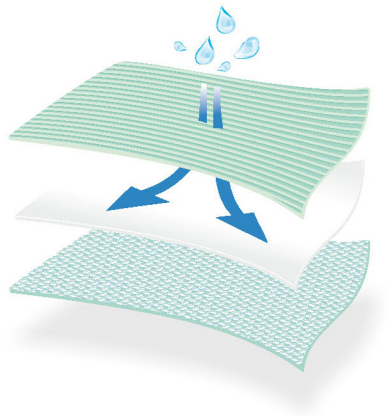
REUSABLE BARRIER SURGICAL DRAPES

MEDIDRAPE

Reusable devices such as surgical drapes, surgical gowns and surgical clothing must, in addition to comfort, provide protection against infection for both patients and medical staff. The TZMO Group offers devices for direct sale as well as leased. With safety and comfort in mind, we have developed barrier reusable devices: Medidrape surgical drapes and Medidress gowns and clothing for the operating suite.

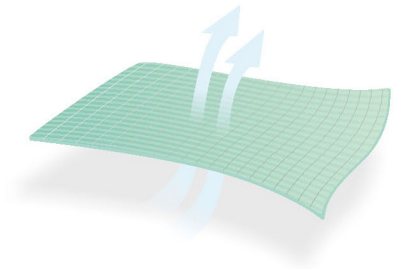
SURGICAL DRAPES

Surgical drapes are made from two types of fabric. They protect the operative wound against bacteria coming from the patient's skin (the surface around the wound) and from the medical staff.
In the critical area, the drapes are made of a 3-layer laminate which guarantees barrier and absorbency.
In the less critical area, the device is made of lightweight polyester fabric with a special weave which does not weigh down the patient and has high air permeability.
Medidrape drapes meet the EN 13795 standard for high requirements.



Three-layer laminate

- high absorption capacity
- barrier properties for microorganisms
- comfort for the patient



Polyester fabric

- high air permeability
- barrier and anti-electrostatic properties
- high resistance to mechanical damage

The modular surgical drapes system allows surgical sets to be freely composed according to medical procedures. All components of the sets are selected to cover the patient as properly and effectively as possible, as well as to cover the Mayo tables and instruments.

CITONET

In addition, the service provided by CitoNet offers drapes equipped with washable medical adhesives, elastic elements and markings to facilitate the positioning of the drapes on the patient.

REUSABLE BARRIER SURGICAL GOWNS

MEDIDRESS STANDARD

SURGICAL GOWN

The Medidress STANDARD surgical gown is designed for standard-risk surgery. The special fabric of the gown meets all the requirements of EN 13795. The surgical gown is designed to be repeatedly washed and sterilised according to the parameters indicated by the manufacturer.

DEVICE CHARACTERISTICS:

- light and resistant
- does not build up electrical charges
- has good vapour-permeable properties, making it comfortable to use

In addition, the service provided by CitoNet offers protection of the external ties with a special card, which makes it easier to put on the gown in a sterile manner.

REUSABLE BARRIER SURGICAL GOWNS

MEDIDRESS PERFECT

SURGICAL GOWN

The Medidress PERFECT gown is designed for high-risk operations with a large volume of fluids.
It is made of two types of fabric. The front and forearms are made of 3-layer laminate, providing a barrier to microorganisms and liquids. The shoulders and back of the gown are made of polyester and vapour-permeable fabric. The surgical gown is designed to be repeatedly washed and sterilised according to the parameters indicated by the manufacturer.

DEVICE CHARACTERISTICS:

- barrier to liquids and microorganisms
- does not build up electrical charges
- has good vapour-permeable properties, making it comfortable to use

(1) Fastening with 3 stainless press studs to regulate the neck size. **(2)** Colour trimming to identify size. **(3)** Concealed folded backstitches prevent the fabric from fraying and loose threads. **(4)** Sleeve seam in the critical area secured with special tape, giving a greater barrier to liquids (PERFECT). **(5)** Long polyester cuff finished with a thumb band to prevent the sleeve from pulling up. **(6)** Information labels to mark "use cycles" and a conservation instruction.

REUSABLE SURGICAL BARRIER CLOTHING

MEDIDRESS

SURGICAL CLOTHING SETS, SURGICAL DRESSES

Medidress clothing is used in the operating theatre and meets all the requirements of EN 13795.

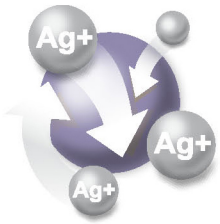
Surgical clothing sets and surgical dresses are made of fabrics:

- polyester with bacteriostatic finishing which inhibits bacterial proliferation **(1)**
- polyester/cotton fabric providing high vapour permeability **(3)**
- having carbon thread which prevents the build-up of electrical charges **(2)**.

Polyester clothing is light and airy, while blended clothing has a high level of absorbency and gives a feeling of comfort comparable to cotton clothes.

1

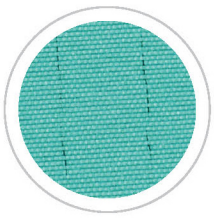
surgical polyester clothing with bacteriostatic finishing

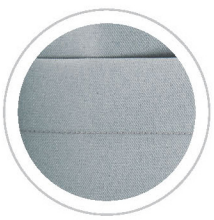


- inhibits the activity and multiplication of *Staphylococcus aureus* bacteria
- eliminates perspiration odour
- anti-allergic properties

2

surgical clothing with carbon thread





CITONET

In addition, CitoNet's service includes modern systems for clothing distribution.

REUSABLE SURGICAL BARRIER CLOTHING

MEDIDRESS

SURGICAL CAPS

Medical caps are made of special polyester and polyester-cotton materials, giving a pleasant feeling when wearing. The cap has a deep rim allowing to precisely hide hair and ties to attach and adjust the cap to the head circumference.

1

The offer of caps includes:

- polyester caps **(1)**
- polyester-cotton caps combined with an absorbent and sweat-resistant polyester knitted crown **(2)**
- polyester knitted caps with antiperspirant properties **(3)**

MEDIFIT

SHIRTS, GOWNS, PANTS AND SKIRTS FOR MEDICAL PERSONNEL

When creating our offer of clothing for medical personnel, we have made every effort to ensure that our devices are of the highest quality, provide maximum comfort and are easy to care for. As a manufacturer of fabrics for healthcare facilities, we have designed the highest quality polyester/cotton fabrics. Appropriate fabric finishing – bleaching, dyeing and sanforising – ensures that the clothing produced is resistant to high-temperature washing. When used, the devices are less prone to creasing, do not discolour and do not change size.

The entire offer of clothing for medical personnel can be found in the Medifit catalogue, which is available on the **en.matopat-global.com** website.

BED LINEN

The reusable bed linen on TZMO's offer is manufactured from cotton or polyester and cotton fabrics with a weight of 140g to 160g, characterised by high tear strength.
Thanks to special fabric finishing processes, the bedclothes achieve dimensional stability, smoothness and shine.
All the fabrics used for bedclothes are **OEKO-TEX STANDARD 100** certified and meet the standards for bedclothes used in health care.

Bed linen can consist of items such as

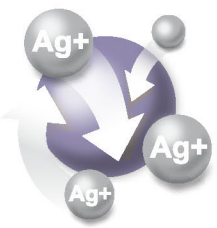
- sheets, duvet covers, pillowcases and underlay.

! At the customer's request, it is possible to have inscriptions permanently woven into the fabric.

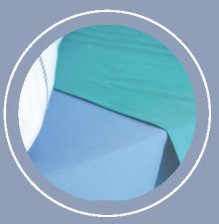
MEDILINEN – REUSABLE FABRIC BED LINEN (medical device)

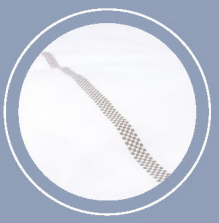
An additional wash-resistant bacteriostatic finishing which:

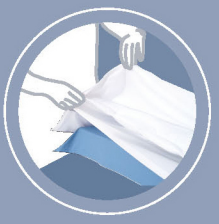
- **inhibits the activity and multiplication of *Staphylococcus aureus* bacteria**
- **eliminates perspiration odour**
- **anti-allergic properties**



! The entire bed linen offer can be found in the *Reusable bed linen catalogue*, which is available on the **en.matopat-global.com** website.

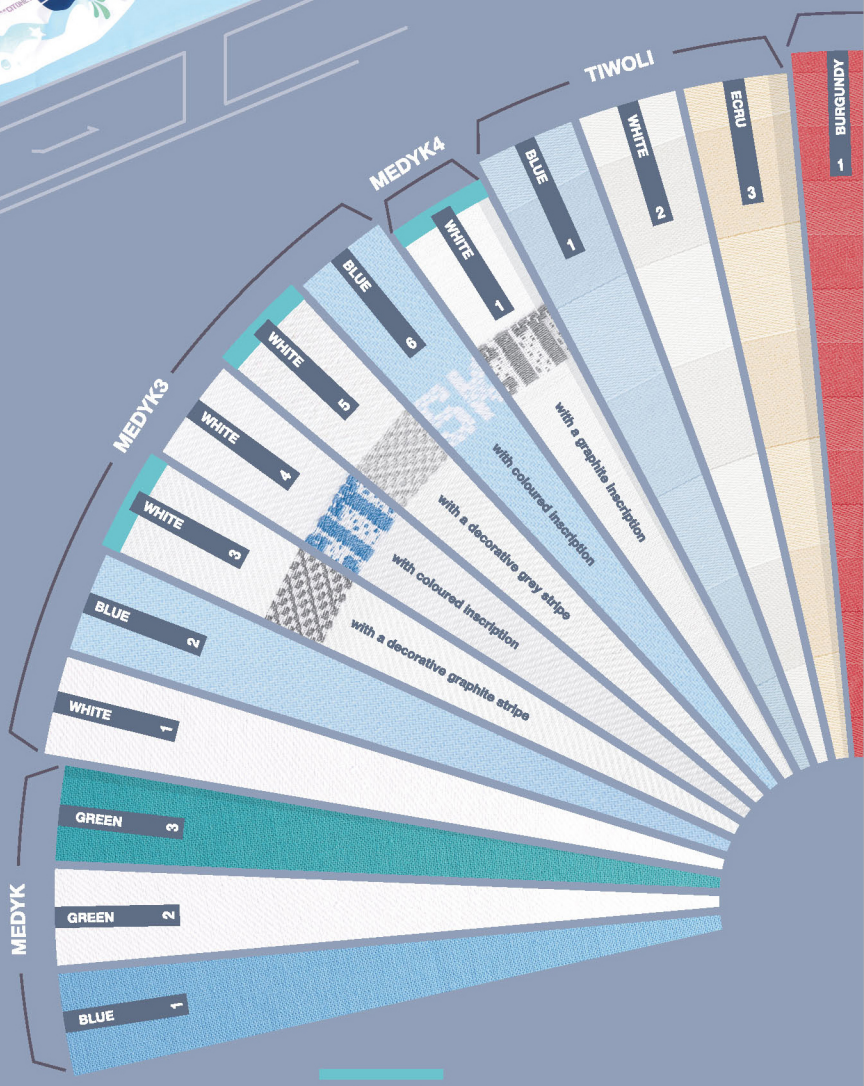




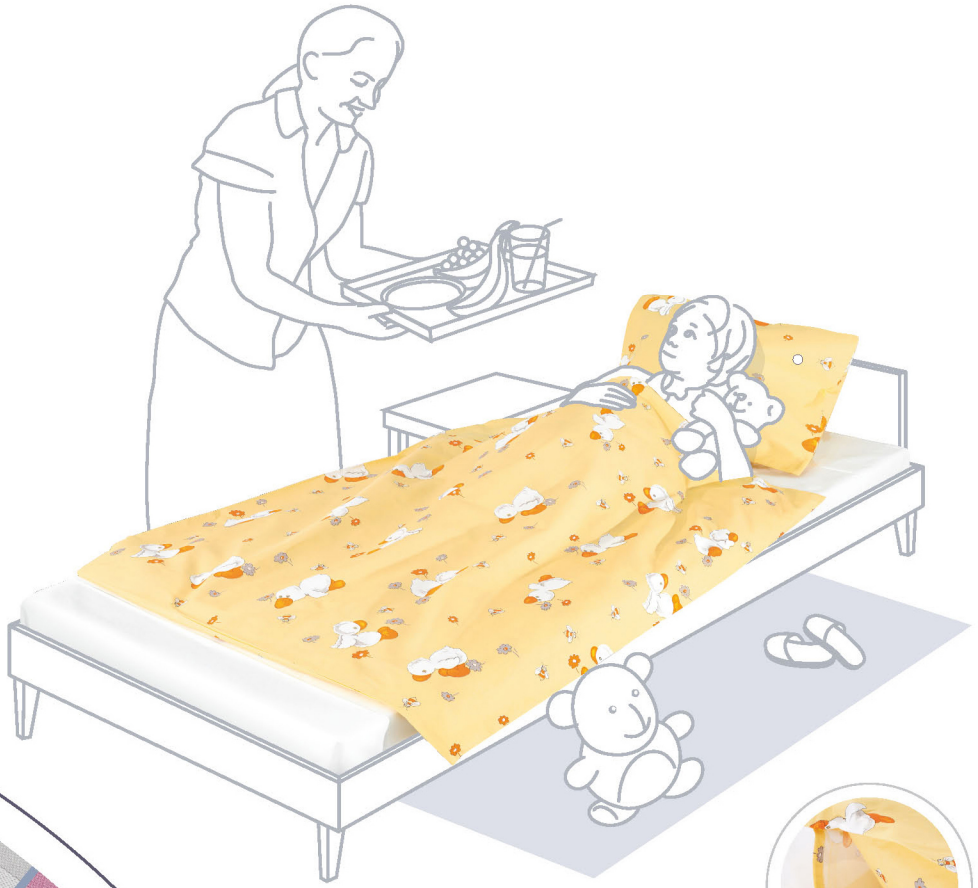


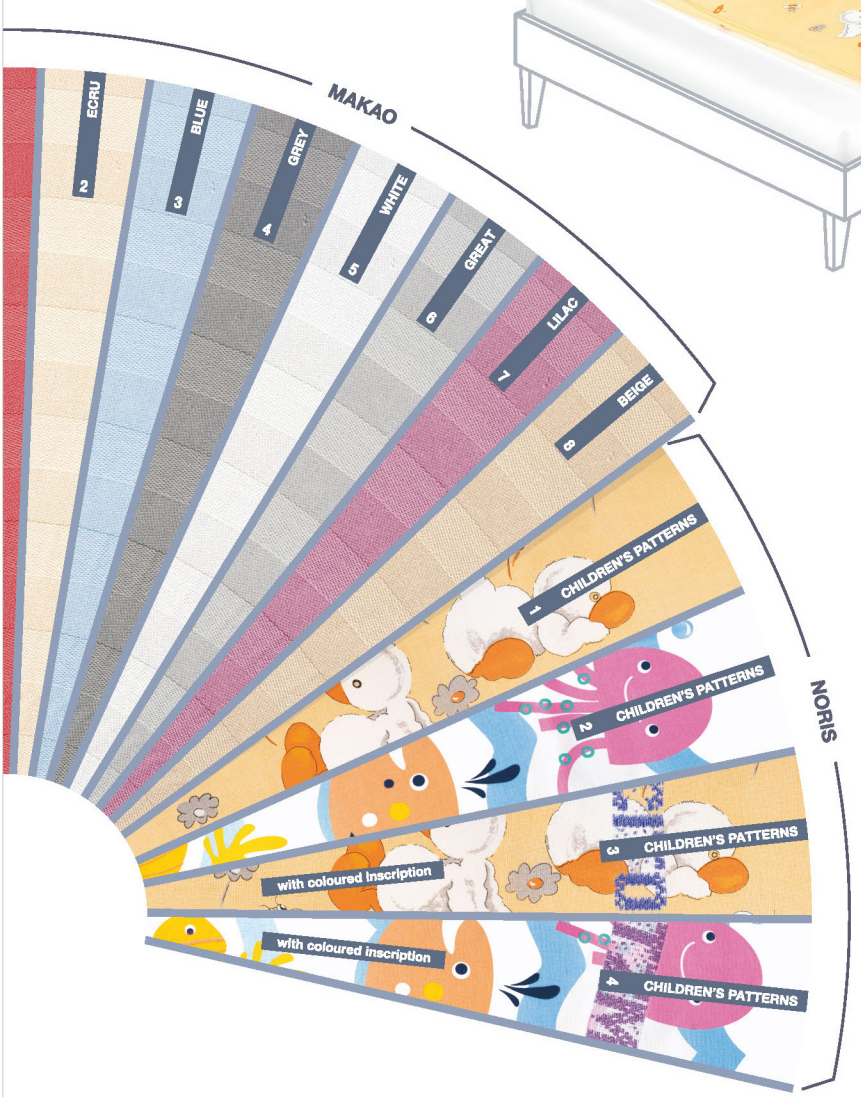
We also recommend cotton colour bedclothes for neonatal and children's wards.

Colour palette



Fabrics for bed linen available in the CitoNet service





The children's bed linen presented on this page have received a positive opinion from the Mother and Child Institute as a product safe for children.

GIPSET

FAST-SETTING PLASTER BAND

Gipset fast-setting P.o.P bandage is characterised by high utility performance. A specially selected plaster composition applied to a high-quality gauze carrier allows a strong and durable dressing to be applied in a very short time.
It is ideal for paediatrics and operating theatres.

Setting time – approx. 3 – 3.5 minutes.

Coloured P.O.P. bandage can be used to mark the first dressing applied to a patient, which should be under special observation due to possible complications.
In paediatrics, the colourful P.O.P. bandage cheers up children and is part of their daily dressing.

LONGETA GIPSET
PREGIPS S / LONGETA PREGIPS S

FAST-SETTING PLASTER BANDAGE

The fast-setting Gipset band is also available as a plaster bandage, which is a 4-layer band in 10 m or 20 m lengths, designed to create plaster shells and sectional reinforcements of a plaster dressing. The layering of the plaster bandage facilitates the process of modelling the plaster shells without the need for layering from a traditional band. Thanks to the use of high-quality ingredients, the plaster bandage allows the application of a dressing with a strong, fracture-resistant surface.

Setting time – approx. 3 – 3.5 minutes.

FAST-SETTING P.O.P. BANDAGE AND FLAT P.O.P. BANDAGE

The fast-setting plaster band Pregips S has high-performance characteristics and is a popular type of plaster band for surgery and orthopaedics. It finds its application in the creation of a plaster dressing for most common fractures and the correction of deformities. The band is also available as a 4-layer Pregips S LONGETA.

Setting time – approx. 5 minutes.

PREGIPS 12 · MATOSOFT

LONG-SETTING P.O.P. BANDAGE

The long-setting plaster bandage Pregips 12 is characterised by a long time of setting and duration of plasticity. The 6-minute plasticity duration makes it easier to work with large and complex plaster dressings consisting of several plaster bands, such as a plaster corset or hip basket. The long setting time allows all layers of the plaster dressing to be completely and permanently bound together.

Setting time – approx. 12 minutes.

ORTHOPAEDIC PADDINGS

The use of pads provides ideal padding under a plaster dressing. The pads protect the patient's skin from the high temperatures generated during the setting of the plaster and from pressure. They minimise the risk of abrasions and irritation. Soft and fluffy, they adjust perfectly to the body shape and provide comfort and safety.

We offer two types of orthopaedic paddings:

- Matosoft NATURAL – natural orthopaedic padding made of viscose. Together with the Tubula Cotton sleeve, it provides natural protection for the skin.
- Matosoft SYNTHETIC – synthetic orthopaedic padding made of polyester. Recommended for use with the Tubula tubular bandages.

TUBULA • TUBULA COTTON

TUBULAR BANDAGES

Tubular bandages are recommended to be applied under synthetic and traditional immobilising dressings. Together with the Matosoft orthopaedic paddings, they protect the patient's skin against external factors, e.g. pressure from the dressing or abrasions on the outgrowths.

There are two types of tubular bandages:

- Tubula COTTON – cotton tubular bandage is used as the first layer of the underplaster dressing. Together with the Matosoft NATURAL orthopaedic padding, it forms a complete natural underplaster dressing which protects the patient's skin from irritation and heat emitted by the hardening plaster dressing. The Tubula Cotton bandage also protects the patient's skin from the sharp edges of the plaster. It absorbs sweat and moisture.
- Tubula – synthetic tubular bandage is used as the first layer of the underplaster dressing. Together with the Matosoft SYNTHETIC orthopaedic padding, it forms a complete synthetic underplaster dressing that protects the patient's skin from the irritation and heat emitted by the hardening plaster dressing. The Tubula bandage also protects the patient's skin from the sharp edges of the plaster. By adhering to the skin, it keeps it dry and clean.

BOM FLAT PAPER-FILM POUCHES FOR STERILISATION
BOM FLAT PAPER-FILM REELS FOR STERILISATION

Paper-film pouches and reels can be sterilised with steam, ethylene oxide and formaldehyde. The sterilisation indicators are printed on the paper within the seam, outside the loading area, which protects them during sterilisation.

We also offer pouches and reels with increased basic weight of the paper for heavier, more demanding loading.

ADVANTAGES:

- high-quality, damage-resistant laminate
- medical paper of high resistance to moist
- transparent film laminate enables easy identification of the content
- packaging allows opening with minimised dusting, increasing safety in the operating theatre
- wide range of sizes enables matching suitable packaging

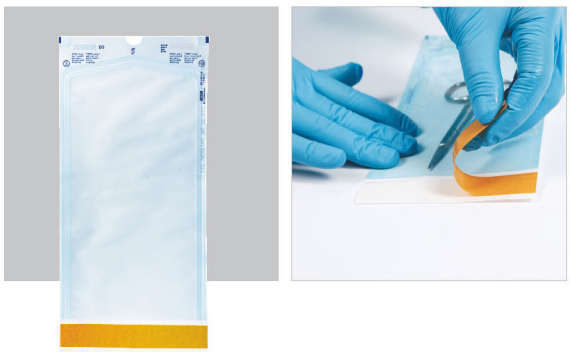
BOM ADHESIVE PAPER-FILM POUCHES FOR STERILISATION

Paper-film pouches are suitable for sterilisation by steam, ethylene oxide and formaldehyde (using the appropriate indicator for formaldehyde). Indicators of the sterilisation process are printed on the paper at the top of the pouch, outside the loading area, ensuring safety during sterilisation. Thanks to the use of double-sided perforated adhesive tape, the pouch closure does not require the use of a heat sealer.

We also offer self-adhesive pouches with a higher paper weight for heavier loadings.



ADHESIVE **POUCHES** (STEAM, EO)

ADVANTAGES:

- high-quality, damage-resistant laminate
- medical paper of high resistance to moist
- transparent film laminate enables easy identification of the content
- dust-free opening of the packaging increases safety in the operating theatre
- wide range of sizes enables matching suitable packaging
- perforation facilitating the closure

Chemical indicators used on the packaging:

steam sterilisation

– in the form of a pink rectangle which turns brown after sterilisation using this method

before sterilisation — after sterilisation

ethylene oxide sterilisation

– in the form of a blue rectangle which turns yellow after sterilisation by this method

before sterilisation — after sterilisation

Expiry period: 5 years from the date of manufacture given on the packaging.

BOM FLAT TYVEK®-FILM REELS FOR STERILISATION

A group of packaging intended for plasma sterilisation. They are made of top-quality materials which do not contain cellulose and consist of transparent, multi-layer polyester/polyethylene film and white synthetic Tyvek® material.

Upon individual customer's request, we can also produce Tyvek®-film reels:

- with indicator for ethylene oxide sterilisation of devices
- without indicator for ethylene oxide or radiation sterilisation of devices

FLAT TYVEK®-FILM **REEL** (VH2O2)

ADVANTAGES:

- material with increased tear and bulge resistance
- transparent film laminate enables easy identification of the content
- sterilisation indicators are printed on the paper within the seam, outside the loading area, which protects them during sterilisation
- dust-free opening of the packaging increases safety in the operating theatre
- wide range of sizes enables matching suitable packaging

The following chemical indicators are used on the packaging:

VH2O2 (PLASMA)

Expiry period: 5 years from the date of manufacture given on the packaging.

BOM FLAT NONWOVEN-FILM POUCHES FOR STERILISATION
BOM FLAT NONWOVEN-FILM REELS FOR STERILISATION

Nonwoven-film pouches and reels can be sterilised with steam, ethylene oxide and formaldehyde. The packagings are recommended for large and textile loads (gowns, bedding, etc.) – they provide better permeability for the sterilising agent.

ADVANTAGES:

- transparent film laminate enables easy identification of the packaging content
- sterilisation indicators are printed on the paper within the seam, outside the loading area, which protects them during sterilisation
- packaging allows opening with minimised dusting, increasing safety in the operating theatre
- wide range of sizes enables matching suitable packaging

Chemical indicators used on the packaging:

steam sterilisation
– in the form of a pink rectangle which turns brown after sterilisation using this method

pink before sterilisation — brown after sterilisation

ethylene oxide sterilisation
– in the form of a blue rectangle which turns yellow after sterilisation by this method

blue before sterilisation — yellow after sterilisation

formaldehyde sterilisation
– in the form of a pink rectangle which turns green after sterilisation using this method

pink before sterilisation — green after sterilisation

BOM CREPE PAPER IN SHEETS – PACKAGING FOR STERILISATION

Crepe paper is used for packaging medical supplies to be sterilised by steam, ethylene oxide, formaldehyde and radiation. According to the requirements, a so-called double layer, i.e. packaging in two sheets of paper, should be used for the packaging of medical devices, which increases the strength of the packaging and provides an additional guarantee of sterility. Packing in two sheets of paper of different colours makes it easier to verify possible damages to the packages.

Available colours:

Expiry period: 5 years from the date of manufacture given on the packaging.

Nonwoven sheets (wetlaid and SMS type) are used for packaging medical devices to be sterilised. Sterilisation by steam, ethylene oxide, radiation and formaldehyde is permitted.
In addition, the SMS nonwoven can be sterilised with hydrogen peroxide. Thanks to its high tearing, puncturing and tensile strength and high softness, the material is recommended for wrapping medium to large-size sets, e.g. orthopaedic instrument sets. For the packaging of heavy sets, the use of SMS nonwoven fabric, which has increased strength parameters, is recommended. The nonwoven material is anti-reflective, anti-rustling, anti-static and dust-free. It has high resistance to permeation by water and low-voltage liquids, including alcohol (according to European standards).
It can be used as a covering for countertops and trolleys and as a sterile field.

Available colours:

ADVANTAGES:

- excellent permeability for the sterilising agent in numerous sterilisation methods
- dimensional stability when dry and wet
- non-toxic, dust-free, anti-static, ensures safety of use
- high tensile strength
- wide range of sizes enables matching suitable packaging
- provides an antibacterial barrier
- colour variants allow for introducing additional identification procedures

BOM AFTER-STERILISATION BAGS (ADHESIVE)

The bags provide dust protection and are used to protect sterile packages. Closed bags provide additional protection to extend the storage period after sterilisation.

AFTER-STERILISATION **BAGS**

size	code	packaging	box
150 mm x 250 mm	OM-196-MMMM-101	500 pcs	1 pack
200 mm x 300 mm	OM-196-MMMM-102	500 pcs	1 pack
300 mm x 500 mm	OM-196-MMMM-103	250 pcs	1 pack

600 mm x 760 mm	OM-196-MMMM-106	100 pcs	1 pack

ADVANTAGES:

- effective protection of packages against dust and moisture
- self-adhesive quick-release fastener for easy use
- particularly recommended for use in combination with sterilisation paper or nonwoven fabric (as additional protection)
- can also be used for other hospital purposes – as a disposable protection for contaminated material

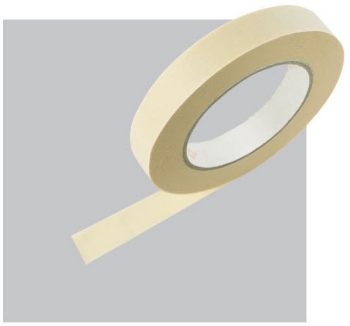
Expiry period: 5 years from the date of manufacture given on the packaging.

ADHESIVE TAPE (WITHOUT STERILISATION INDICATORS)

The tapes are used for closing packages to be sterilised.

ADVANTAGES:

- thanks to the adhesive layer, the tape adheres easily to a variety of surfaces and is easy to remove without leaving residue
- suitable for sterilisation by steam and ethylene oxide
- allows nonwoven or crepe paper packages to be quickly and conveniently secured/closed



ADHESIVE TAPE **WITHOUT INDICATORS**

size	code	packaging	box

OPTOMESH®

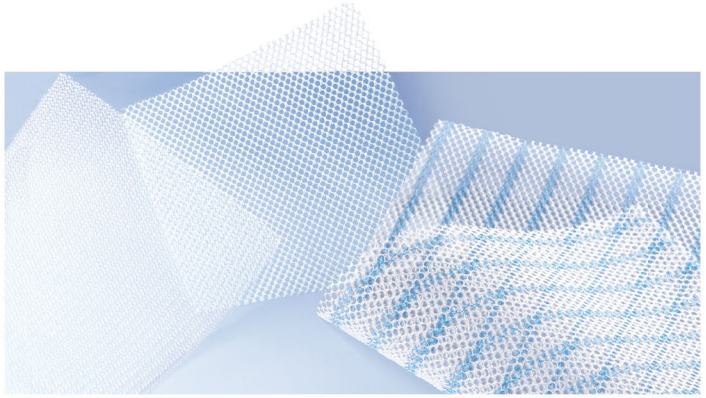
SURGICAL HERNIA MESH

Optomesh® non-resorbable surgical hernia meshes are made of monofilament polypropylene yarn. They are characterised by high mechanical strength, good fixing, non-fraying edges and high resistance to tearing out sutures.

They are offered in two types:
- **MACROPORE –** mesh with big pores,
- **THINLIGHT –** mesh with standard surface of pores.

Optomesh® mesh implants are available in a full range of sizes. The product does not contain any substances of allogeneic or animal origin.
In the MACROPORE variant blue orienting lines are used to facilitate the visibility and positioning of the product in the operating field.

Available in a sterile version (EO).



Application:

They are recommended for reconstructive procedures in order to strengthen places with soft tissue defect in the case of abdominal hernias i.e.:
- primary and recurrent,
- incisional hernias,
- inguinal and femoral hernias,
- umbilical hernias,
- linea alba,
- with large gates

OPTOMESH® ULTRALIGHT

SURGICAL HERNIA MESH

Optomesh® ULTRALIGHT non-resorbable ultralight surgical hernia meshes are made of transparent and blue monofilament polypropylene yarns.

Optomesh® ULTRALIGHT is offered in three types:

- **L-Pore** – with very large pores (surface ca. 6 mm^2),
- **M-Pore** – with large pores (surface ca. 4 mm^2),
- **S-Pore** – with small pores (surface ca. 1.3 mm^2).

Optomesh® ULTRALIGHT mesh implants are available in a wide range of sizes, of various weights and mechanical properties which are adapted to the size of the hernia gate. The meshes do not contain substances of allogeneic and animal origin. The L-Pore and S-Pore variants have blue orienting lines facilitating the visibility and positioning of the product in the operating field.

Available in a sterile version (EO).

Application:

They are recommended for reconstructive procedures to fill in and/or strengthen the defects of soft tissues in the event of the following abdominal hernias:

- primary and recurrent,
- incisional hernias,
- inguinal and femoral,
- umbilical,
- with large gates.

Depending on the type of hernia and its size, the appropriate surgical mesh can be selected:

- **L-Pore** for hernias with a small defect in the connective (fascial) tissue,

- **M-Pore** for small, medium and large hernias,

- **S-Pore** for small and medium hernias.

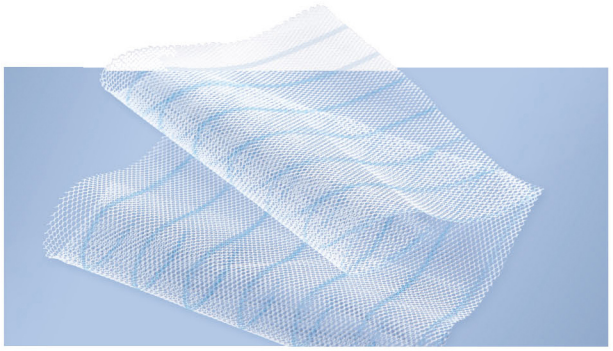
OPTOMESH® SUPERULTRALIGHT

SURGICAL HERNIA MESH

Optomesh® SUPERULTRALIGHT non-resorbable ultralight surgical hernia meshes are made of transparent and blue monofilament polypropylene yarns.
Optomesh® SUPERULTRALIGHT mesh implants are available in a full range of sizes and do not contain substances of allogeneic and animal origin. The product has blue orienting lines facilitating the visibility and positioning of the product in the operating field.

Available in a sterile version (EO).



Application:

They are recommended for reconstructive procedures in order to strengthen places with soft tissue defect in the case of abdominal hernias:

- primary and recurrent,
- incisional hernia,
- inguinal and femoral hernias,
- umbilical hernias.

Optomesh® SUPERULTRALIGHT is recommended to be used for hernias with a small loss of connective (fascial) tissue.

OPTOMESH® 3D

SURGICAL MESH FOR INGUINAL HERNIA REPAIR

Optomesh® 3D non-resorbable surgical meshes are products with a spatial structure, made of transparent and blue monofilament polypropylene yarns..

The product is offered in four types:

- Right, size S/M,
- Right, size L,
- Left, size S/M,
- Left, size L.

Optomesh® 3D implants have a marker that facilitates mesh implantation, made of blue polypropylene yarn. Optomesh® 3D products do not contain substances of allogeneic and animal origin..

We also offer an Optomesh® 3D surgical mesh, with the spatial structure, adapted to the patient's anatomy.Optomesh® 3D is an innovative surgical device developed on the basis of computed tomography, which allows for the selection of the perfect shape adapted to the anatomical structures of the patient's groin.

Available in a sterile version (EO).

Application:

They are recommended for reconstructive procedures to supplement and/or strengthen the defects of soft tissues in the case of inguinal hernia, both primary and recurrent.

SURGICAL MESHES

OPTOMESH® STOMA

SURGICAL MESH FOR PARASTOMAL HERNIA REPAIR

Optomesh® STOMA non-resorbable surgical meshes are made of transparent and blue monofilament polypropylene yarns. The device is available in one size: 195 mm x 195 mm, but the dimensions may be modified by the surgeon during implantation in order to adjust the shape to the individual patient's anatomy. The implant does not contain any substances of allogeneic or animal origin. The product has blue orienting lines facilitating the visibility and positioning of the product in the operating field.

Available in a sterile version (EO).

Application:
They are recommended for use during the surgical treatment of the causal or preventive occurance of parastomal hernias.

G-MESH®

GYNAECOLOGICAL MESH FOR SURGICAL TREATMENT OF PELVIC ORGAN PROLAPSE

G-Mesh® non-resorbable gynaecological meshes are made of transparent and blue monofilament polypropylene yarns. At the ends of the arms the product has projections that facilitate passing them through the openings in the applicator. The implant does not contain any substances of allogeneic or animal origin.

G-Mesh® product is offered in three types:

- Posterior 2 type – two-arm mesh,
- Anterior 4 type – four-arm mesh,
- Posterior 6 type – six-arm mesh.

Available in a sterile version (EO).

Application:

Used in reconstructive surgery for pelvic organ prolapse (POP). While the decision on how to implant the mesh into the patient's body is made by medical specialist, it is recommended that:

- Posterior 2 or Posterior 6 be used for patients with symptoms such as rectoceles and enteroceles,
- Anterior 4 be used for patients with cystoceles,
- Posterior 6 be used for patients with uterine prolapse or vaginal vault prolapse.

DALLOP® NM ULTRALIGHT / DALLOP® NM

UROLOGICAL TAPE FOR SURGICAL TREATMENT OF URINARY INCONTINENCE

DALLOP® NM ULTRALIGHT and DALLOP® NM non-resorbable surgical urological tapes are made of polypropylene monofilament yarn: transparent in Dallop® NM and transparent and blue Dallop® NM ULTRALIGHT.
The Dallop® NM ULTRALIGHT product has a blue line along the product, which facilitates visibility in the operating field and enables its identification when tension improvement is needed. The products are equipped with blue handles that facilitate fixing the product on an applicator. The products do not any contain substances of allogeneic or animal origin.

Available in a sterile version (EO).

Application:

They are recommended for use during the surgical treatment of Stress Urinary Incontinence (SUI).
The devices are intended for implantation using the following methods:

- Tension-Free Vaginal Tape (TVT),
- Trans Obturator Tape (TOT),
- Tension-Free Vaginal Tape-Obturator (TVT-O).

APPLICATORS*

AUXILIARY INSTRUMENTS FOR SURGICAL TREATMENT OF URNARY INCONTINENCE

The applicators are non sterile, reusable surgical instruments made of stainless, martensitic steel, meeting the requirements of standards on surgical instruments.

Application:

They are used in surgical treatment of urinary incontinence in women depending on the method used by the specialist:

1. TVT applicator is an auxiliary instrument used in the TVT method (Tension-Free Vaginal Tape).
2. TOT applicator is an auxiliary instrument used in the TOT method (Trans Obturator Tape).
3. A set of the TOT applicators consists of two applicators being mirror images of each other. It is used in the TOT method (Trans Obturator Tape).
4. A set of TOT applicators consists of two applicators being mirror images of each other. They are used in the TOT "outside-in" method (Trans Obturator Tape).

BONE PROSTHESES

CODUBIX® / CODUBIX® S

PROSTHESIS FOR CRANIOPLASTY

The prosthesis for cranioplasty is knitted of polyester and polypropylene yarn. Thanks to its good ability to deform, it does not undergo mechanical damage under external forces. High strength, low specific weight, almost complete luck of liquid and physiological fluid absorption, non-toxicity, high degree of healing in and no shadowing for X-rays allow the prosthesis to be easily identified with the natural cranial bone.

Available in sterile (STEAM) and non sterile version.
In either case, follow the applicable Instructions for Use.

For craniotomy we recommend also sterile operation sets:
• MB-136-ZOL2-005 • MB-136-ZOL3-003 • MB-136-ZOL3-011

Application:

The Codubix®, Codubix® S knitted cranial bone grafts are intended for the reconstruction of skull cap defects.

CODUBIX® / CODUBIX® S

We also offer the prosthesis for cranioplasty adapted to the patient's anatomy, performed on the basis of the analysis of image data obtained in a CT scan using specially developed software for this purpose – Codubix® CT. The analysis of such CT images and computer modelling enable the preparation of a matrix to form a Codubix® (CT) and Codubix® S (CT) cranial prosthesis.

The implantation of such an individually adapted prosthesis improves the surgeon's comfort, reduces operative time and blood loss, affecting the safe use of the product. At the same time, it helps to obtain an optimal cosmetic effect. The use of computer modelling allows for the preparation of the cranial prosthesis individually adjusted to the shape of the patient's head.

CODUBIX® ORBITAL WALL / CODUBIX® ORBITAL WALL 3D

PROSTHESIS OF ORBITAL WALL

The prosthesis of orbital wall bone is knitted of polypropylene yarn. High strength, low specific weight, hydrophobic properties, contributing to the lack of liquids and physiological fluid absorption, non-toxicity and chemical inactivity allow the prosthesis to be easily identified with the natural bone. Codubix® ORBITAL WALL can be modelled easily during the implantation and can be diagnosed.

The Codubix® ORBITAL WALL 3D prosthesis has an anatomical shape and is available in right and left version, each in three sizes. The prostheses also come in sets.

Application:

It is indicated to reconstruct orbital wall bone defects (zygomaticomaxillary -orbital fractures, isolated fractures of orbital wall) as a result of middle facial skull bone fractures after traumas or other causes.

Available in a sterile version (STEAM)

PROSTHESIS OF CODUBIX® ORBITAL WALL, **STERILE**

CODUBIX® RIBS / CODUBIX® S RIBS

PROSTHESIS FOR CHEST WALL DEFECTS

The Codubix® RIBS prostheses are knitted of polyester and polypropylene yarn. The products are characterised with high strength, low specific weight, hydrophobic properties, contributing to the lack of liquid and physiological fluid absorption, non-toxicity, chemical inactivity and high degree of healing in. The products are easy to model during implantation and enable diagnostics without giving artefacts.

Application:

They are used to fill chest wall fragments after the treatment of primary and metastatic tumours affecting this structure and infiltrating non-small cell lung cancer.

Available in a sterile (STEAM) and non sterile version.
In either case, follow the applicable Instructions for Use.

COLOURED MARKING BANDS

CODOLOOPS®

COLOURED MARKING BANDS

Coloured marking bands are used for retraction of organs dissected during surgical procedures. They are knitted of polyester yarn in the form of bands with the edges rolled inside. The properties of the pattern reduce fraying on cut-ends.
The Codoloops® bands are available in three widths and four colours: white, yellow, red and blue.

Available in a sterile version (R).

Application:
Recommended for retracting and supporting separated organs during a surgical procedure:
■ red – arteries, ■ blue – veins,
■ yellow - urinary ducts, □ white – nerves.

ABOUT TRICOMED SA

TRICOMED SA – MORE THAN 60 YEARS OF TRADITION

The company was founded in 1959, since 1995 as a joint-stock company, now part of the TZMO Group. In 1961, the first Polish vascular prosthesis manufactured by Tricomed was implanted (two years after a similar operation in the United States) – the patient lived with the prosthesis for 45 years and died at the age of 76. One of the few companies in the world specialising in the creating and producing knitted Class III medical devices.

All the company's products meet safety requirements and have been CE-marked. The company has highly qualified staff, modern research facilities and experience, and collaborates with medical authorities in the field of implant surgery. It has received many awards and the products are used in many centres at home and abroad.
On 6 July 2009, it received the status of Research and Development Centre and its scientific specialisation is bone prostheses, surgical meshes and modern speciality dressings.

Quality International 2020

Golden QI Emblem in the 14th edition of the Highest Quality QI Programme in the Highest Quality Management category.

2017 award

Tricomed SA is the winner of an award from the Polish Centre for Testing and Certification for manufacturing high-quality medical devices.

"Lodz Eureka" 2018

Award in the "technology" category for the following devices: Optomesh® ULTRALIGHT, Dallop® NM ULTRALIGHT and G-Mesh® gynaecological meshes.
